With the aid of an empiric formula it was possible to
account approximately for the intensity of the red line
on the basis of ionospheric data during the first part
of the night. A supplementary phenomenon, perhaps
the arrival of arctic air, complicated the interpreta-
tion of observations during the second part of the night.

Photometric observation of the red rays of oxygen in the light of the night sky has made a significant contribution to the study of the phenomena of the upper atmosphere at the height of about 250 km. It also permits the analysis of the structure of the polar aurora in regions of relatively low latitude. (Author)
