EFFECT OF LOW CONCENTRATIONS OF PLASTICIZER IN VINYL CHLORIDE POLYMERS. Presented to the Expanded Macromolecular Colloquium, Freiburg, 6-8 Mar 58. [1963] [11]p. (figs. omitted) 8 refs.  
Order from SLA \$1.60

63-14184

Trans. of Kunststoffe (West Germany) 1959, v. 49, no. 5, p. 213-216.

DESCRIPTORS: Polymers, \*Polyvinyl chloride, \*Plasticizers, Vinyl radicals, Chlorides, Mechanical properties, Molecular structure.

The brittling effect occurring in PVC and vinyl chloride mixed polymers with low plasticizer concentrations is explained by the assumption that the plasticizer molecule in low concentrations causes, by solvation, above all, a stretching of the macro-  
(Biological Sciences--Pharmacology, TT, v. 10, no. 3)  
(over)

molecule. By this solvation the macromolecules become immovable and make the "softened" material harder. Only with higher concentrations of plasticizer is the peculiar plasticizing effect of the plasticizer fulfilled. The data obtained for several plasticizers, for pure PVC, for a vinyl chloride mixed polymer, for plasticizer to which was added a precipitant for the polymer, may be arranged easily in this conception. Some recently appearing articles concerning this same effect are examined critically. (Author)
