A comparatively large number of television pictures of
 wave clouds associated with obstacles taken by the Cosmos-122
 satellite are analyzed above mountainous regions in the Urals and
 eastern Siberia. The characteristic scale of wave movements is
 determined from the television pictures. Statistical analyses of
 rawinsonde data on temperature and wind are used as a basis for
 drawing conclusions regarding the nature of the temperature
 stratification within the cloud layer and the wind-field pattern in the
 air layer below the clouds. Graphs are provided which allow use
 of television pictures of wave clouds to determine the wind speed
 and direction.
