DESCRIPTORS: *Poisonous gases. *Chemical warfare
agents. *Gas detectors. Determination.

An apparatus is described for detecting small quantities
of all kinds of combat gases in air, and gases found
around industries and plants manufacturing halogen-
substituted materials (e.g., carbon tetrachloride, tri-
chloroethylene, chlorobenzene, and the refrigerants of
the freon type). The apparatus is small and simple. A
miniature electric-powered fan drives the air to be
tested through a small catalyst (pipe) chamber where
the gas to be analyzed is heated over a platinum elec-
trical coil. The acid products emitted are led over a

DESCRIPTION: *Electron microscopy. *Aluminum.
Thickness. Determination. Measurement. *Surfaces.
Single crystals. Crystal structure. Isolation.

Measuring methods for the determination of thickness
and average distance between the traces of slip
bands are discussed. In all cases the average slip per
band was found to be less than 100 Å. A
relation between the average distance between slip
bands and the average slip per band was found.
The average distance between slip bands was found to
be a function of the average slip per band.
