An examination is made of condensation on non-
soluble nuclei and on nuclei soluble in a liquid. It was
found that, for polar substances on even surfaces the
vapor adsorption isotherm like the vapor tension
isotherm, and new liquid phase formation occurs in
certain instances by an intermittent process of two-
dimension nucleus formation. The liquid phase forms
a marginal angle distinct from zero. The mechanism
of vapor condensation on the completely wetted particles
was analyzed and it was found that the introduction of
vapors of certain organic liquids may change the

DESCRIPTORS: *Insecticides, *Particles,
*Sedimentation, Tests.

An investigation of sedimentation of DDT and hexachlorane dusts in a vertical aerodynamic tube indicated that sedimentation of dust-like particles is not as high as is indicated by the Stokes' Formula either with or without the correction by Shchepkovich. This is because the particles form agglomerates. When calculating sedimentation velocity, the "assumed density" of
