

ORD # 2227-73

MEMORANDUM FOR: Director Central Intelligence
CIA Management Committee

SUBJECT : Biofield Measurement Project at
Stanford Research Institute

1. The following is a brief description of the scope, results, and goals of a current project involving biofield measurements at Stanford Research Institute. The initial project was a \$7,000 effort completed in January 1973. Currently, a \$50,000 effort is being completed and a \$19,000 increase in scope is requested. If the results justify continuance, a similar effort, shared between TSD and ORD, is envisioned for next year.

2. It has long been claimed that certain gifted individuals have had the ability to perceive and produce physical effects by paranormal means. Recently, two *appear to have* individuals, Mr. Uri Geller and Mr. Ingo Swann, demonstrated these abilities under controlled laboratory conditions. The abilities of these individuals are now being submitted to a serious scientific investigation, part of which is being supported by the above mentioned project.

3. The goals of the current project are to achieve unequivocal scientific verification of the existence of these abilities. ^{SHOULD BE} ~~Once~~ ^{of} ~~verification is reasonably assured,~~ ^{of} ~~the nature of the phenomena will be investigated.~~ ^{ORD} ~~will undertake the task of understanding and recording the phenomena, with the goal of establishing a physical basis so that further exploitation may proceed in a systematic manner.~~ ^{permitting more precise and effective long range} ~~TSD will simultaneously explore the limitations and properties of the phenomena, attempting to establish cause-effect relationships which can lead to more immediate exploitation.~~

It will be possible with the wire-wire channel - i.e. that needs to be right in the way of involvement

... using agency prepared controlled materials which would permit us to eliminate the possibilities of, even, subconscious act-giving in the part of the advertising ads.
