

the potential of
 SUBJECT: After action evaluation of "Grill Flame (GF) Generated
 data to support the BG. DOZIER rescue operations.

Summary: Considering the relatively small amount
 of fuel back acquired to substantiate the accuracy
 of the 229 Remote Viewing (RV) statements the 40.4% correlation
 with the target remains is good. However of more
 interest than the target correlation is the fact that
 the potential for isolating the target area within
 the confines of a specific city or a political Borough or district
 was available from RV data approximately 15.5 hours after
 the abduction. This is based upon the community
 analyst's assumption that the abductors would
 travel no more than one & one half hour from
 the abduction site. Within this confine there
 was only one city that fit the fifth RV statement
 which was further amplified in the first statement of
^{of the RV session conducted in following days}
~~drawings~~. The city was described as being surrounded
 by the moat or the rivers. Both Verona and Padova were
 considered in this statement ^{from rivers} Padova is surrounded by
 moats, rivers & canals. The session also contained a
 drawing which indicated the target was across
 the river from the moated city. The drawing best
 fit the S.W. corner of Padova. Two circular
 areas of probability, 500m in radius were established
 from that drawing, one of which lay in the
 Bassanello Borough or district. The second statement
 of the session describes the target area as a low
 depression area which is a good translation of the
 Borough name Bassanello.
