

SG1J
SRV ENVELOPE 12 MARCH 1987

Site involves silvery, rounded, cylindrical, metallic objects that are smooth and horizontal, and lying at obtuse or acute angles in relationship to each other. Objects seems to be half imbedded in the ground, and have an inside. They are in some sense structural. This inside component involves "space" and "containing." There is a valuable/expensive sense about these structural objects, as if they are expensive to produce because of the processes involved, but must be so constructed to adequately perform their function. Red is associated with the site. People don't spend a lot of time here, but come to accomplish a supervisory, maintenance, or operational purpose, then leave. It is not necessarily potentially healthy to be in the vicinity of these structural objects. Care has been exercised in making them and the area as safe as possible, but sensible precaution dictates being in the area only when really necessary. People without a direct affiliation with the site are never allowed access to it, and it would be impossible for someone to accidentally wander accross it. Operations associated with the site involve turning some sort of control to transfer something from one place to another, and also ~~to~~ bring new "batches" or "lots" of something into the site, or move ~~em~~ "batches" or "lots" of this/these same something(s) that have already been there for a while back out again to somewhere else. At least one other, different structure at the site permits one to obtain an overall view of the compound within which these structural objects are locatd. Brown is an important color to the site, along with a sense of viscosity and causticity.
