

# Neuropsychology

23 Aug 1982

Phone call to Dr. Frazier recalled...  
The following were:

1. Rosenblum finally was able to reach some 82 DIA agent The Soviet Psychoenergetic Research Program and was considerably impressed
2. Dr. Frazier went to a briefing at the DIA's office on DIA operational use of PSI to locate penetration which is successful enough to impress the DIA. It is not scientifically controlled but results are sufficiently useful to have significant requirements for continued use. Reading of his done characteristics is considered an unusually hard task for such talent (?) even getting titles or documents is "iffy" Frazier is considering telling the DIA that our work with Type experiments are almost useless. And to seek other assistance. 105com is mostly operational except for some SR1 work (see other side for new research)

( - call Kit )

3. Dr. Frazier said that it was a good idea to talk to Dr. Scatta who is a medical scientist but associated with the field and worth to learn as much as possible (see other side)

Conducted by SSI/AF. Mr. Barry Stang

NAT

*Note*

The SRI research on MX missile basing  
indicated a credible threat to pseudo random  
systems under some circumstances.
