Libya - Rate of Urbanization v. Rate of Total Population Growth

The graph shows the comparison between the rate of urbanization and the rate of total population growth in Libya from 2000-2005 to 2025-2030. The blue line represents the urban growth rate, while the orange line represents the total population growth rate.

Key observations:
- There is a significant increase in both urbanization and total population growth during the period 2010-2015.
- The urban growth rate peaks around 2015 and then decreases, while the total population growth rate also shows a decline after 2015.
- The graph indicates a trend of decreasing growth rates post-2015, with the urban growth rate stabilizing after 2020 and the total population growth rate showing a continued decline.

This data suggests a potential slowdown in both urbanization and population growth for Libya in the latter part of the 2010s and early 2020s.
